CPI Satcom Statement on the Heartbleed Bug

The OpenSSL Heartbleed Bug is a critical security vulnerability that affected many Internet sites around the world. The following is CPI Satcom's statement regarding its products and the Heartbleed Bug. More information on the bug can be found at www.heartbleed.com.

CPI Satcom's products do not use OpenSSL; we use a different underlying technology in our products. Therefore, our products were not exposed to this vulnerability. Furthermore, only one of CPI's Internet-facing systems was found to be vulnerable (transfer.cpii.com). It has been updated and is no longer vulnerable. If you were exposed to the vulnerability by this system, you should have received an e-mail from the system requiring you to change your password. If you did not receive an e-mail, you were not exposed.

In order to remain protected against Internet threats such as the Heartbleed bug, we recommend that customers configure their local networks using networking-industry best practices. This will help ensure that the user interfaces on CPI Satcom products are protected by customer firewalls.
